Over the past several years, digital system design has become dominant in the field of VLSI design for relatively high performance and cost-effective VLSI circuits. The objective of this blog is to provide easy tutorials on designing easy to complex designs using Verilog. The topics covered in this blog are digital system

The start signal starts the multiplication process. It loads the multiplicand (a) in a register and also loads the multiplier (b) in another register. Each D flip flop is controlled by a control signal. The DFFs shifts data to the right only when the control signal is high.
