General Tool's newest machine to employ this particular five-axis design is a T-35 machining center from Cincinnati Machine (formerly Cincinnati Milacron; Cincinnati, Ohio). Like many other horizontal machining centers, this one (shown in Figure 1) places a 360-degree, B-axis rotary table beneath the workpiece.

In the simplest terms, 5-axis machining involves using a CNC to move a part or cutting tool along five different axes simultaneously. This enables the machining of very complex parts, which is why 5-axis is especially popular for aerospace applications. However, several factors have contributed to the wider adoption of 5-axis machining.

The DMG MORT's 5-axis control machines boast overwhelming milling performance and operability thanks to some 120 years of the development and production experience in Europe. 5-axis control machines capable of multi-faceted indexing can complete machining in one clamp, which as a result reduces the frequency of setups and simplifies/eliminates fixtures to drastically shorten process times.

Five-axis CNC machine tool is the top product of numerically controlled machine tool. Kinmatic accuracy is an important index to evaluate the quality of mechanism. Kinematic accuracy analysis of the Five-axis machine tool in previous study ignores the randomness of each input error component, so the conclusions are imprecise.

This paper introduces a new parallel mechanism machine tool that can machine the top surface and four lateral surfaces of a prismatic workpiece with one setup. No B-axis motion is necessary. Five-axis simultaneous machining can be executed in any workspace. This machine is based on a new parallel mechanism, Eclipse, which was invented by the authors. The Eclipse allows the spindle of the machine tool to tilt to 90 degrees from the vertical posture, and also to sweep the lateral surfaces of ...

This paper presents a modular method to construct a postprocessor system for a novel hybrid parallel-serial five-axis machine tool. A hybrid parallel-serial mathematical model is introduced to analyze a structural configuration. The configuration decomposition of machine tools is used to create the kernel of the postprocessor.

In this paper, an error modeling method based on multi-body system (MBS) is used to construct the error mapping between error sources and the cutting tool pose error for a five-axis machine tool. According to the error mapping, the traditional definitions of local sensitivity indices (LSIs) and global sensitivity indices (GSIs) are introduced.

5-axis machining is commonly used in the aerospace industry to machine body parts, turbine parts, and impellers with free-form surfaces. The 5-axis machine tool can process different sides of the workpiece without changing the position of the workpiece on the machine tool, which can greatly improve the machining efficiency of the prismatic parts.

Milling is a cutting process that uses a milling cutter to remove material from the surface of a work piece. The milling cutter is a rotary cutting tool, often with multiple cutting points.As opposed to drilling, where the tool is advanced along its rotation axis, the cutter in milling is usually moved perpendicular to its axis so that cutting occurs on the circumference of the cutter.
