Plant enzymes that neutralise fungal toxins can play a role in plant defences, and transfer of their genes can improve resistance (Johal & Briggs, 1992). For example, Fusarium head blight is a significant fungal disease of wheat, as well as a source of mycotoxins in food that can poison humans and animals.

Bacterial blight, blast, and sheath blight are the commonest diseases causing substantial yield loss in rice around the world. Stacking of broad-spectrum resistance genes/QTLs into popular cultivars is becoming a major objective of any disease resistance breeding program. The varieties ASD 16 and ADT 43 are the two popular, high yielding, and widely grown rice cultivars of South India, which ...

To reduce costs of disease preventive measures like vaccination, preventive medication and hygienic procedures are applied. Genetic resistance is an attractive preventive measure because of its consistent nature in the next generations, because it precludes veterinary services and because there are no side-effects.

Genetic resistance, also referred to as host or cultivar resistance, is determined by a specific genotype in the resistant host variety, relative to other varieties possessing distinct genotypes that confer susceptibility. Employing host resistance machinery through the conventional breeding has long been one of the most effective and sustainable ways to control diseases caused by plant pathogenic microbes including viruses.

Common solutions include constant breeding for disease resistance, use of pesticides, use of border inspections and plant import restrictions, maintenance of significant genetic diversity within the crop gene pool (see crop diversity), and constant surveillance to accelerate initiation of appropriate responses. Some pathogen species have much greater capacity to overcome plant disease resistance than others, often because of their ability to evolve rapidly and to disperse broadly.

For effective control of different infectious diseases in chicken, the best and most reliable approach is the improvement of the genetics of disease resistance. Enhancement of immune responses may lead to improved efficacy of vaccines and disease resistance, hence reduction in drug residues in the food products.
